J. Noble, H. Raubenheimer, J. Smit, P. Smit & A. Wagener

All the work contained in this document is entirely my own, unless otherwise stated.

This dissertation is a design exploration for the development of an aquatic science park that is simultaneously functioning as a ferry terminal, at the water's edge of Maputo bay, in Mozambique. The project primarily seeks to redefine the edge as a space of interaction between humans and marine environments.

The dissertation addresses the needs of researchers from different institutions around the country for a research facility catering for marine environment issues. The proposal also intends to re-establish a ferry that was discontinued due to construction of a suspension bridge across Maputo bay linking two districts namely Maputo and Katembe. The new bridge is not pedestrian friendly, therefore the need for an alternative link. The research facility will be a place where visitors can experience the marine world and learn about species from waters around the world.

The dissertation presents the researcher's attitude toward the creation of "in-between" place by blurring the lines between distinct realms, such as manmade and nature, public and private sectors, activities on land and in water, etc. The blurring process is the subject of this thesis; its development responds to the conditions and needs within the existing context and is stated in the programmed requirements.

The dissertation will prove that the re-establishment of the ferry coupled with a new research facility could improve connectivity between the Katembe district and Maputo city and also transform the area into a more integrated ecological system to protect and conserve water.

# ACKNOWLEDGEMENTS

I would like to express my appreciation toward several people. I owe my deepest gratitude to my supervisors, Prof. Jan Smit, Petria Smit, Hein Raubenheimer, Prof. Jonathan Noble and Annemarie Wagener for having graciously contributed their time and expertise to the development and completion of this thesis.

I must express my special thanks to my lecturer and friend Jako Olivier for the contribution of his knowledge, encouragement and inspiration since the day I set my foot at the Department of Architecture.

And finally, I would like to acknowledge my family and friends for their magnificent support... even when the skies were not as clear as they are now. I am indebted to my daughter Nivalda for her support, patience and endurance throughout this odyssey.

# Introduction

All creatures have depended on the waters of the earth for their survival. The rivers, lakes, oceans and seas have been a source of nourishment, migration and mystery throughout history. In the process of drinking and finding food in the water, humans developed a fascination for water and devised means to swim through or float on the water.

We discovered distant lands, using water as a means of transport. Great tales were told about the power of the sea and the remarkable creatures that live beneath its surface but now, unfortunately, we are finding ways to destroy the water and with it the aquatic life (Cromie, 1966: 35).

Not only humans but all living things stand or fall together. Or rather human is of all such creatures least able to stand alone. If we think only in terms of our own welfare, we are likely to find that we are losing it (Bendiner, 1981: 147).

Urban waterfronts, where the land of city meets a body of water, are unique and finite resources representing the best opportunities for community enhancement and enrichment. On the other hand, waterfronts are also high risk areas, where water-related disasters could seriously affect the long-term sustainability of our urban environment. This dissertation focuses on the relationship of the city with its waterfront. The design will start by studying the city of Maputo at large scale where waterfronts play an important role in its urban planning policy.

The mechanism of waterfront transformation will be investigated and aimed at finding out which strategies to adapt and what resilience means in terms of urban waterfronts in a rapidly transforming city.

Some representative urban projects on the waterfront will be examined and summarize spatial models applied on the waterfront with distinct policies.

Finally, it will be demonstrated that an urban waterfront is an "osmotic interface" which should be more correctly envisaged as a network of places, functions, additions and hinges between the city and its water environment. We clarify that waterfront areas represent a multidisciplinary and multi-tasking issue from the perspective of urban resilient development.

## STRUCTURE OF DOCUMENT

The dissertation is structured in four sections. The first section contains an overview of the physical context and its impact on the organisation of the building.

The second section explores the location of various use-forms on the site.

A design synthesis - that is, a process of combining pieces of knowledge into a meaningful whole is considered in the third section. In this section, an overall building organisation and forms are developed.

And the final section critically investigates the structural components of the design with regards to its various constituents used to put the building together.

# RESEARCH METHODOLOGY

The following research methods will be explored in this study:

+ **Touchstone.** An abstract representation to capture the essence of the project. In other words, it is a tool to convey central idea.

+ **Conceptual Framework** is used as a guide for research and design development to analyse conceptual ideas .

+ **Precedent and case studies.** Local and international examples will be critically analysed in order to establish current typological characteristics. Programmatic precedents will also be investigated.

+ **Literature review.** A survey of related literature including the following topics in substantiation of the argument: the threshold, the in-between, the edge and boundaries.

+ **Personal Interviews.** Conduct interviews with local community, researchers and students from biological sciences to examine the need for the facility.

+ **Site visit.** A visit to Maputo, Mozambique. This will entail visiting the proposed site as well as prominent colonial and modernist buildings to draw inspiration from.

+ **Site analysis.** Document current site conditions including slope, vegetation, views to and from the site, orientation, access, neighbouring buildings, prevailing wind, sun paths, etc.

# 1.1 Project Rationale and Background

## 1.1.1 INTRODUCTION

This chapter provides a project rationale and background of the physical context geared to the typological and morphological investigation of the existing city fabric on various scales, ranging from the scale of the city to the scale of the building.

## 1.1.2 THE NEED FOR RE-ESTABLISHING THE FERRY IN MAPUTO BAY

The waterborne public transport system across Maputo Bay is currently managed by TransMaritima S.A., a state owned company. Transmaritima SA presently serves one destination in Greater Maputo, a ferry for passengers from mainland Maputo to Inhaca Island. Both use the same terminal in Baixa. Until November 10th, 2018 there was also a service carrying passengers, vehicles and goods from Maputo to Katembe district but this was withdrawn due to construction of suspension bridge across Maputo bay.

According to Deacon (2011) six vessels used to operate in the Maputo Bay from the existing terminal comprising of:

- Two large passengers, vehicles and goods ferries alternating between Maputo city and KaTembe district (Figure 1.3). These vessels used to operate 7 days a week with up to 18 return services daily moving an average of 4000 commuters every day and carrying up to 20 vehicles per trip.
- Three privately owned small vessels provided an alternative water taxi service on the same route between Maputo city and KaTembe (Figure 1.4). These boats, nicknamed "Mapapais" run on a needs basis rather than a regular schedule. They operate seven days a week between 06:00 and 19:00. They can carry up to 30 passengers.
- And finally, a scheduled three times a week ferry service to Inhaca Island catering primarily for tourists (Figures 1.5, 1.6 & 1.7).

## 1.1.4 MANGROVE DEGRADATION IN MAPUTO

Mangroves are amongst the most productive marine ecosystems on earth, they are habitats for a large number of fishes and marine invertebrates in their early life cycles. The mangrove prop-roots create a special underwater habitat, especially during the breeding and early stages of the fish lives (El-Regal & Ibrahim, 2014: 72).

Despite the vital role of mangroves as nursery grounds for juveniles of some reef fish species, several studies have revealed a significant decrease in mangrove forests, primarily due to heavy human pressure. Beside human influences, mangroves are also suffering from climate change (Moussa, 2017: 328). According to Rahman & Asmawi (2016), habitat destruction through human pressure has been the major cause of mangrove loss.

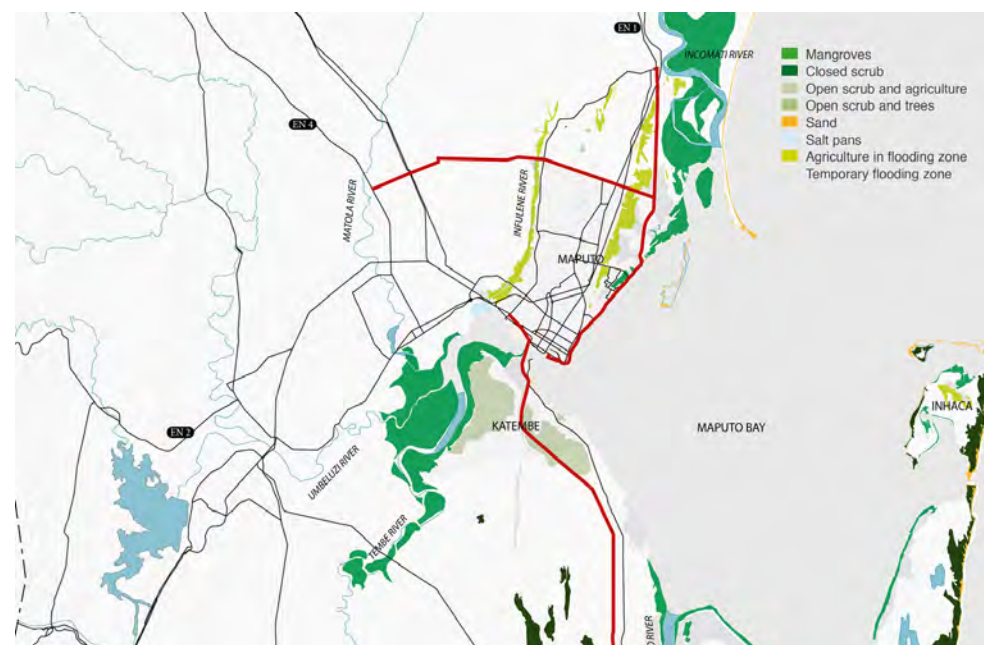

There are various causes of mangrove destruction, ranging from high demand for land for housing and industries, agriculture conversion, the need for fuelwood and land reclamation for urban development (Rahman & Asmawi, 2016: 661).

Mangrove wood is hard and insect-resistant. The harvesting of mangroves for timber and fuel, like basic fishing techniques, has been practised for thousands of years (WWF, 2020: online).

Figure 1.9. Mangroves at Inhaca Island, Maputo (Costa & Ribeiro, 2017: Online)

## 1.2 TOUCHSTONE

The research section of this document will begin with a brief discussion of the touchstone. The central idea behind the project is to redefine architecture and its relationship with nature.

In our ever changing world, how can buildings and infrastructure be designed to both protect the environment and withstand it?

The proposal seeks to implement 'resilient design principles' to develop a research facility that respect and respond to the environment on its surroundings. Sustainable design principles are inherent in resilient design, as minimizing additional environmental impact and protecting limited natural resources (Kranbuehl, 2016: online).

For the purpose of this study, seven resilient design principles, as set out by Kranbuehl, will be implemented to inform the design process, namely:

01. Transcend scales;
02. Protect the natural environment and resources;
03. Anticipate interruptions and adversity;
04. Simple, passive, and flexible space;
05. Durable materials and systems;
06. Locally available, renewable resources and;
07. Diverse and redundant systems

## 1.3 Thesis Statement

Figure 1.16. The Maputo-Katembe Bridge under construction in 2017  
(GAUFF, 2020: 4-5)

Figure 1.17. The Maputo-Katembe Bridge under construction in 2017 (GAUFF, 2020: 18)

For a long time Mozambicans have envisioned making the country accessible from north to south via roads and motorways and in particular, to create a connection from Maputo city to KaTembe district. Thanks to the transport connection to the Southern coastal region, a development corridor was created, primarily providing tourism infrastructure, as planned in the KaTembe District Master Plan (GAUFF, 2020: 3).

The KaTembe district is located on the southern bank of Maputo Bay; the district today is sparsely populated when compared to other districts within the Great Maputo (BETAR, 2016: 2). KaTembe remained underdeveloped and isolated from the rest of Maputo city, primarily due to lack of physical infrastructure. Before the Maputo-Katembe Bridge<sup>1</sup> was built, the only connection to the city was by ferry.

Figure 1.18. The Maputo-Katembe Bridge (Macauhub, 2018: Online)

The country's infrastructure network is a rapidly growing focus area, where the Maputo-Katembe Bridge represents a further step towards the continuous improvement of the national network. The direct link between the capital city and Kwazulu Natal, in South Africa, is considered a trade route capable of launching economic growth to the next level. The creation of this trade corridor is part of the national development masterplan, which provides for the inception of infrastructures to support tourism and, consequently, for the generation of new jobs, for growth and for the development of the southern region of the Maputo Province (GAUFF, 2020: 5).

1. The Maputo-Katembe bridge is a suspension bridge across Maputo Bay with a main span of 680m and a total length of 3 km; its construction started in 2014 and was completed in 2018.

## 1.4 Client Profile

Figure 1.19. Logo of Eduardo Mondlane University (The Ocean Foundation, 2020: Online)

Figure 1.20. Logo of the City of Maputo Municipality (Infomoz, 2020: Online)

The proposed research facility will be financed and run by a joint venture between two institutions, namely the Department of Biological Sciences, Eduardo Mondlane University and the City of Maputo Municipality through their National Strategy and Plan of Action for Conservation of Biodiversity in Mozambique (2015-2035) with additional funding through PPP (Public-Private Partnership).

## 1.5 User Profile

Figure 1.25. Maputo: boarding the ferry to Catembe (Zug55, 2012: Online)

The research facility will primarily house researchers from the Department of Biological Sciences, Eduardo Mondlane University to conduct studies in the areas of aquatic energy conduction, biology and aquatic infrastructure. The project is also anticipated to accommodate students from local universities and in addition the local community. The aquatic science park will bring together the brightest minds in the field of marine biology and alike from across the world, ranging from biologists to engineers.

## 1.6 Typology

### 1.6.1 PRECEDENT STUDY 01: LISBON OCEANS PAVILION

Architects: Cambridge Seven Associates  
 Location: Parque das Nações, Lisbon, Portugal  
 Project Year: 1994-1998  
 Size: 215,000 square feet  
 Type: Aquarium

The Oceans Pavilion (Oceanário de Lisboa) was designed by Peter Chermayeff, principal of Cambridge Seven Associates, for Portugal's world exposition - EXPO '98, the final world's fair of the 20th century. The typology of this building is an aquarium. The central idea behind the design of the aquarium was "all of the world's oceans form one great sea" (Ivy, 1998: 106) and this was the theme and unifying element of the Oceans Pavilion. A huge, 1.22 million- gallon tank, 110 feet square and almost 22 feet deep, lies at the heart of the pavilion, informing the architecture and organizing the aquarium around the concept: the interrelationship of global waters.

The facilities built in the run up to the 1998 event were planned to both host a world class event and be incorporated into the city at later stage (Clark, Huxley & Nemecek, 2010: 10). The theme of the fair was "The Oceans: A Heritage for the Future" and this was reflected in the regeneration that took place.

Figure 1.26. Exterior View (Bernhardt, 2017: Online)

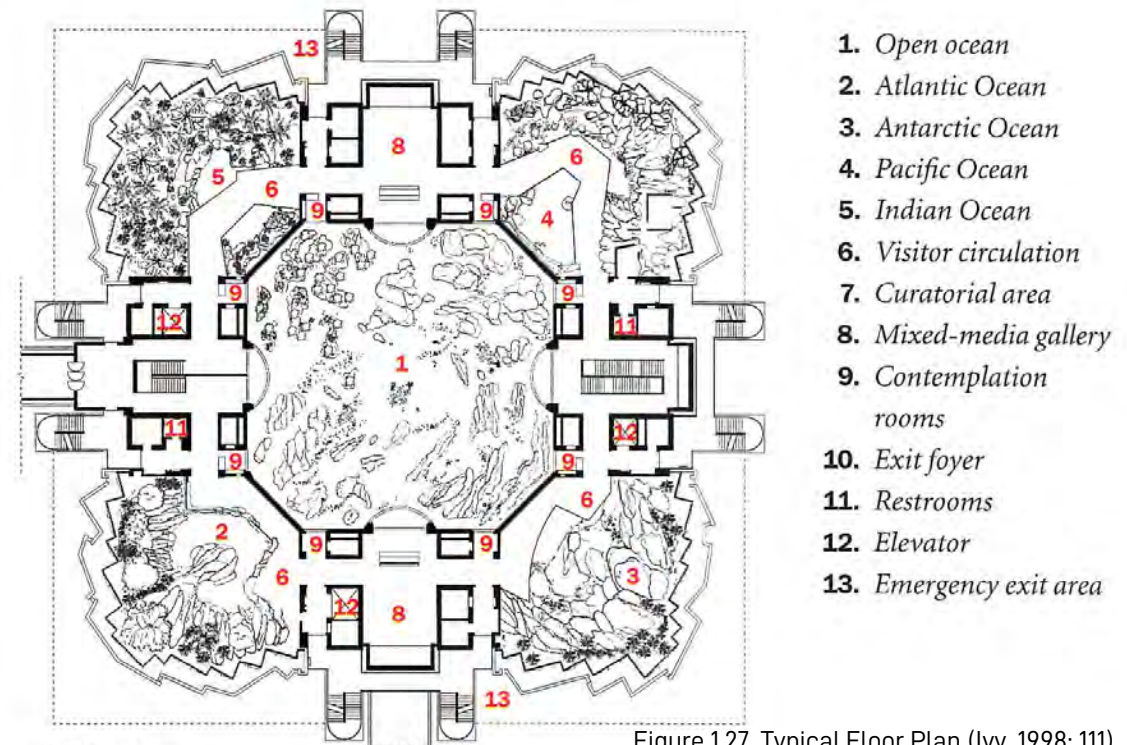

Figure 1.27. Typical Floor Plan (Ivy, 1998: 111)

Figure 1.28 Oceans Pavilion Bridge (Bernhardt, 2017: Online)

### Lessons learnt

The Lisbon Oceans Pavilion attempts to bridge a gulf between the Lisbon's past and its future, between pessimism and optimism, decline and growth. This gulf is expressed in the physical face of the city, in the contrast between its declining historic core and the emerging new developments on its periphery.

The aquarium is a perfect example of blurring the lines between marine life and the human realm. Enveloped by marine life around them, the visitors are earth-bounded interlopers at the Oceans Pavilion.

The building features stone walls systems for exterior envelopes and a truss system topped by masts and petal-like glass-and-steel canopies. The detailing of the building allows indirect daylight to bathe different surfaces and model the shadows, creating a magical sense of positive spatial presence.

The EXPO facilities were deliberately positioned in a decaying ex-industrial district on the north bank of the River Tagus, which was subsequently transformed into a waterfront for the city.

A two-level bridge (figure 1.29) connects the aquarium and the support building, where tickets are sold and groups congregate. Along the wall of the support building is an intriguing mural made of blue and white Portuguese tile. Metal stairways wind up the sides of the aquarium. Glass roofs and glazing at the four corners admit daylight. A cross section of the Oceans Pavilion (figure 1.29) shows the clear span provided by the external truss system. The topography of the ocean environments is also clear, with the shore structures tucked into the glass-roofed corners and the adjacent tanks.

Figure 1.29. Cross section showing clear spans (Adapted from Ivy, 1998: 108)

## 1.6.2 PRECEDENT STUDY 02: MARINE EDUCATION CENTRE IN MALMÖ

Architects: NORD Architects

Location: Malmö, Sweden

Project Year: 2016

Size: 700.0 sqm

Type: Research Centre

Figure 1.30. View from sea (ArchDaily, 2020: Online)

The Marine Education Centre in Malmö, designed in 2014 by NORD Architects as a competition entry, is a learning facility that explores the effects of climate change on marine life. The key concept for the centre is to “blur the distinction between architecture and landscape” (Rosenfield, 2014: online) while simultaneously serving as a teaching device in environmental issues.

The proposal blends indoor and outdoor spaces under a huge roof where landscape and building become one entity. The project features programs such as flexible learning spaces, floating laboratories on small removable pontoons, underwater sea binoculars as well as teaching signs on the seabed.

Moreover, the building itself is promoting a sustainable approach and the roof expresses a performative combination of sustainable concepts and technique. All technical installations like water handling and circulation, solar energy production and consumption and ventilation were all on display in competition proposal and part of the total learning experience on resources and sustainability (Rosenfield, 2014: online).

Figure 1.31. Section \_ Scale: N/S (ArchDaily, 2020: Online)

### Lessons learnt

This Community Facility has proven that architectural spaces have the ability to act as a social engineer within a specific context. This building has proved to be more than a centre, but rather a community generator by providing a more legible and coherent complex that the community understands. The facility has successfully engaged with the site from edge to edge through a simplification of the design synthesis and the choice of materials. While not a broad and complicated brief, the response has addressed complex issues such as sustainability (figure 1.32).

In essence, the Marine Education Centre has achieved its primary objective of providing innovative solutions to maximise energy efficiency and thus, reducing environmental impacts. The building has been designed to set a new precedent in environmental education. Sustainable strategies used include passive heating and ventilation systems, solar energy panels and a rainwater collection system.

## 2.1 Research Question

How can architecture act as a device for preserving a fragile ecosystem in the KaTembe district by transforming the existing ferry terminal into a new ecological corridor that encourages interaction between people and marine life?

Figure 2.1. Circles in a circle by Kandinsky (Adapted from Bauhaus Movement, 2020: Online)

## 2.2 Community Comments

## 2.3. CONCEPTUAL EXPLORATION

### 2.3.1 CONCEPT 01

- + LINEARITY
- + CONNECTIVITY
- + GRID AS SPACE

The site's landscape suggests a much calibrated space that can maximize the interaction between people and marine environments. By organising space in a linear setting, people need to constantly negotiate the space and obstacles. The people visiting the research facility will be able to walk, run, jump and rest on a series of spaces between water and land.

Figure 2.2. Diagram of Concept 01 (Author, 2020)

Figure 2.3. Photo of conceptual model (Author, 2020)

Figure 2.4. Photo of conceptual model (Author, 2020)

## 2.3.2 CONCEPT 02

- + JUXTAPOSITION
- + DISCOVERY/ EXPLORATION
- + PATH AS VOLUME

The second concept addresses the existing ferry terminal as a landscape, allowing users to experience the juxtaposition of architecture and water as they navigate through the building. The design weaves together land and sea while giving fresh vitality through its framing of the ocean and the Maputo unique skyline.

Figure 2.5. Diagram of Concept 02 (Author, 2020)

Figure 2.6. Photo of conceptual model (Author, 2020)

Figure 2.7. Photo of conceptual model (Author, 2020)

### 2.3.3 CONCEPT 03

- + BLURRING EDGES
- + MOVEMENT
- + TRANSFORMATION

The shore by its nature is a movement. Be they movement of water, the movement of sand, the movement of air and ultimately the movement of people. The shore is also a transformation.

Transformation of ebb into flow, transformation of dusk into dawn, transformation of matter into sand, transformation of daytime heat into evening coolness.

Users can freely navigate through all spaces of the building and may choose where they want to be, outside under the canopy, inside the building or on the beach. All movement inside and through the building is fluid and not limited by sharp corners or visual barriers.

Figure 2.8. Diagram of Concept 03 (Author, 2020)

Figure 2.10. Photo of conceptual model (Author, 2020)

Figure 2.11. Aerial photo (Wade, 2015: Online)

## 2.4 THEORETICAL GROUNDING

### INTRODUCTION

A literature review will provide the reader with a theoretical discourse that will be used as a main morphological informant towards determining a design solution.

### 2.4.1 Edges and the In-between

The in-between in architecture is pertinent to the concept of juxtaposition of spaces and/or places as manifestation of contrasting conditions. According to Dutch architect Aldo van Eyck (1968: 104) the in-between is defined as “the architectural reciprocity reconciling between two extremes such as the inside and the outside, public and private”, an articulation between spaces with a transitional realm. The in-betweens are not two realms that can exist independently, provided each contains the characteristics that make the existence of the other. Therefore, the in-betweens are perceived as potential, undesignated spaces “that can develop into places responsive to at least two sets of conditions at the same time (Kleinsasser, 1981: 92).

In order to understand the concept of environmental juxtaposition, the in-between spaces must act as medium to express forms that lead to experience of spatial-relations. In this sense, forms are not limited to physical shapes but they can also mean patterns, modes and structures depending on the way the in-between is constructed (Langer, 1967: 24). For instance, through different spatial arrangements, different use of materials and their textures or colours as well as different gradations of light and temperature, the user of space receives stimuli that lead them to sensations of being inside or outside. The more expressive this contrast becomes the richer the relationship they establish.

The recognition of the in-between in architecture lies in space-forms: an in-between space, a distinct environmental realm or layer that is established by the attachment to primary and dominant spaces also as a means of separateness and linking as an element of transition.

Figure 2.12. Diagram showing the in-between realms  
(Author, 2020)

Moreover, in-between spaces exist in public and urban realms as much as in architecture. Most common in-between forms in public realms are defined as the boundaries and/or edges of places such as arcades, niches of a façade, colonnades and promenades create the condition of spaces within the space or articulated spaces at the transitional zone—an edge zone (Gehl, 1987: 150-155).

The exterior and interior space cannot always be established as absolute entities. These often assume a greater degree of complexity, changing their identity and unfolding on several levels. Thus, ambiguous spaces are born which lie between being inside and outside. The Parisian arcades (Figure 2.13) are perfect example of ambiguous spaces, making the relation between exterior and interior assume, in many cases, a complex and reversible meaning. Thus, with modernity we would see a series of architectural experiences that would bring about a significant change in spatial relations. The traditional interior, as a closed space as opposed to the outside, loses importance, becoming more open and receptive to receiving what goes on outside.

Figure 2.13. Passage Choiseul - 1910 (Hotel Etats Unis Opera, 2018: Online)

Considering the quality of transition, use and “figure-ground”, in-between realms can be distinguished from left-over space. The term itself, suggests a space as residue; left behind when a space or a building viewed as figure is placed on the location as ground (Alexander, Ishikawa & Silverstein, 1977: 518).

Despite spatial between-ness, a left-over space stands still as a negative, void and shapeless void; therefore, surrounding spaces or buildings remain isolated and are deprived of integrated spatial relationships. This means, left-over space cannot function as transitional element. On the other hand, well designed and articulated in-between spaces create positive, potential uses and transition, with the “distinct and definite shape of a room” their configuration, shape and function are as important as those of spaces or buildings in the context. With quality of potential enclosure and interpenetration with other domains, in-between realms might be seen as figures against the ground of surrounding domains or buildings: “figure-ground reversal” (Alexander, et al., 1977: 519).

In-between realms may vary in spatial conditions, but their form is constructed by the same structures of being between-ness of designated realms and functioning as concurrent mediums of divisions and coherence as transitional modes. They simultaneously overlap and reveal two or more domains, as a configuration of intermediary space.

On one hand, in-between domains are embodied in architecture and clearly understood. On the other hand, in the art of place-making, the in-between has not yet been defined in place-form as the in-between place: an environment which provides relationships to juxtaposing places. The proposed place-form does not lie only in geographical sense but refers to a living realm-the way a place is designed-holding the ontological presence as an entity of being. From the phenomenological point of view, the essence of place: cultivating and dwelling, ultimately “being” presents itself within a clearly established realm that depends on the nature of bounded structure. Heidegger puts in these terms, “A boundary is not that at which something stops, but, as the Greeks recognized, the boundary is that from which something begins its presencing” (Frampton, 1993: 275).

To conclude, the in-between place-form bears an examination regarding the synchronization of the composite terms of the in-between and the place. In other words, an in-between realm presents itself as the in-between functionality of place. Rather than a bounded, ended place in its form, a place of the in-between setting needs to perform as in-between modes: being located in the intermediary and tangible ways of which this subtle layer establishes characteristic relations between juxtaposing domains: its transition and reconciliation nature.

## 2.5 MAPUTO CITY

### ORIGINS + DEVELOPMENT

#### 2.5.1 INTRODUCTION

This section offers a historical overview of urban development in Maputo, including a more detailed analysis of the recent urban expansion. This is followed by a section describing town planning in the post-Independence period.

## 2.5.2 DEVELOPMENT OF MAPUTO

Maputo is a port city and capital of Mozambique, formerly (until 1976) known as Lourenço Marques derived from the Portuguese trader who first explored the region in 1544. The local indigenous people, *the Rongas* nicknamed the city 'Xilunguine', which meant "the white man's place" (Jenkins, 2009: 91). The city lies along the north bank of Maputo Bay, previously Espírito Santo Estuary of Delagoa Bay, an inlet of the Indian Ocean.

In 1721, the Dutch first established a temporary settlement as a coastal trading post. A few years later the British took control of the post and transferred it to the Portuguese in 1781.

The Portuguese finally developed a permanent settlement around a Portuguese fortress in 1787. Created a city town in 1887, it superseded the town of Moçambique as the capital of Portuguese East Africa in 1907 (Lotha, 2007: online).

### 2.5.3 ARCHITECTURAL CHARACTER

Essentially the architectural history of Mozambique has not been much different to that of South Africa. In broad terms, it is characterised by a similar colonial history, by the comparable importation of Victorian and Art Deco styles as well as by the same influence of early modernist tendencies in the 1930s. With urban growth in the 1960s, a mature modernism emerged, amidst which exemplary buildings by architects such as JJ Tinoco and Pancho Guedes became points of reference. In Maputo today, despite the relative isolation of Mozambique since 1974, the state of architecture is not dissimilar to that of contemporary South Africa.

Figure 2.22. The CFM (Caminhos de Ferro de Moçambique) railway station, 1908 (Wolf, [n.d.]: Online)

Figure 2.29. Casa Paulino "Paulino residence" by José Forjaz (José Forjaz Arquitectos, 2003: Online)

Figure 2.30

Figure 2.31

Figure 2.32

Commercial developments, the proliferation of tourist-related facilities and recent gated residential enclaves are increasingly making up much of the current architectural scene, albeit in a context where urban infrastructure provision is neglected. Over the past decades Mozambique has not been exempted from the 'post-modern' disposition which has prevailed elsewhere in the world.

In architectural terms, this tendency has been manifested in a condition of unprecedented stylistic incoherence. With this has come an unusual obsession with form, as well as the veneration of the singular architectural object. Augmented by normative town planning ideas, new buildings seldom contribute towards the making of the public domain, as they typically lack 'urban generosity' and ignore the broader questions of economic, social and environmental sustainability. With this condition, the cities of Mozambique, like the South African cities, have remained as polarised conurbations divided between the rich and the poor - despite the achievement of independence and democracy in the nation states that make up our region.

Figure 2.30. Edifício TAP "TAP Building" (Jenkins, 2015: Online)

## 2.5 The Site

Figure 2.33. World Map highlighting Mozambique (Adapted from SnowFleikuN, 2010: Online)

Fig. 2.34

Fig. 2.35

Figure 2.34. Location of Mozambique within Southern Africa (Adapted from Dill, [n.d.]: Online)

Figure 2.35. Katembe district within Maputo Province (Adapted from BETAR, 2016: 3)

Figure 2.36. The site in the immediate surroundings (Adapted from Google Earth, 2020: Online)

At present, Maputo, the capital of Mozambique is growing with mind-numbing speed, filling up the lowlands with people, as all the highlands are increasingly being built on or covered. The chosen site is located on the south bank of Maputo bay in KaTembe district where an obsolete ferry dock is and offers views directly across the bay towards Maputo city. Forming a tip of land into the sea, the site is waterfront and city gateway and mangrove sanctuary. Many areas of coastal wetlands near the site have been lost or fragmented, as a result of reclamation for development.

These wetlands, which generally acted as a flood basin for Katembe district, are now unable to fulfill their purpose and thus increase flood magnitude and its elongation period. This approach to land development is affecting the resilience of the city. This disturbance of the environment can be termed an 'ecological disaster', making the situation worse for the people of Maputo city. An analysis of the pre-urban and post-urban context will show how the situation worsens with unwise and unplanned decision-making and not respecting the hydrology and its functions. The important observation is, that the strategy of 'flood-free land' should be transformed to 'flood-free building' in the new innovative housing model in this context, which can relate to our society and culture.

## 2.6 Programme

The proposed science park and ferry terminal is a multi-functional building, in which the subunits such as research facilities, educational spaces, temporary and permanent exhibitions, outdoor exhibition areas and the natural spaces are located in such a manner that allows different users' profile to navigate through the building without disruption between activities.

Figure 2.53. Functional diagram (Author, 2020)

## 2.6.1 ACCOMMODATION LIST

### GROUND FLOOR

#### A. PUBLIC

##### i. TICKET BLOCK

01. Ticket Office	27m <sup>2</sup>

## 2.6.2 CORAL REEF EXHIBITION

Figure 2.55

Figure 2.56

Figures 2.55 & 2.56. Diagrammatic section and plan of the Coral reef exhibition (Author, 2020)

### 2.6.2.a) SPECIES

Trigger fish  
Rabbit fish  
Parrot fish  
Angel fish  
Coral catfish  
Hawkfish  
Bluestripe snapper  
Oriental grunt fish  
Unicornfish

Grouper  
Cowfish  
Puffers  
Trunkfish  
File fish  
Mulletts  
Butterfly fish  
Forceps fish  
Triggerfish

### 2.6.2.b) REQUIREMENTS

- > Saline water;
- > 20,000 gallon capacity tank;
- > Total viewing in the round;
- > Diver access;
- > Artificial lighting (simulate day and night cycles);
- > Temperature control (McCosker, 2002: online and Ngeku, 2014: 2).

### 2.6.2.c) DESCRIPTIONS

Multiple level viewing can provide the visitor with scenic displays of the coral and fish varieties offered in the reef. A multi-sensory (kinesthetic) approach to this exhibition would allow visitors, particularly children to experience the small creatures.

## 2.6.3 AQUATIC LIFESTYLES GALLERY

Figure 2.57

Figure 2.58

Figures 2.57 & 2.58. Diagrammatic section and plan of the Aquatic lifestyles gallery (Author, 2020)

### 2.6.3.a) SPECIES

Electric eels	Puff fish
Upside-down catfish	Hog fish
Electric catfish	Zebra fish
Sea horses	Archerfish
Trumpet fish	Jaw fish
Snakehead fish	Frog fish
Lizard fish	Fireworks fish
Clown anemone fish	Leaffish
Elephant nose fish	Butterfly fish

### 2.6.3.b) REQUIREMENTS

- > Saline and freshwater;
  - > Separate small tanks;
  - > Touch tank;
  - > Temperature control;
  - > Artificial lighting
- (McCosker, 2002: online and Ngeku, 2014: 2).

### 2.6.3.c) DESCRIPTIONS

This gallery will contain and display smaller aquaria with a variety of species. Comparisons between the small niches will demonstrate convergent and divergent evolutionary concepts, cryptic coloration, mimicry, electric field generation and territoriality.

# CHAPTER 03

3.1 Urban Design Framework	055
3.1.1 Accessibility	056
3.2 Land-use zoning	057
3.3 Morphology	059
3.3.1 Precedent study 01	059
3.3.2 Precedent study 02	061

## 3.1 URBAN DESIGN FRAMEWORK

The purpose of the urban design framework is to establish parameters which will promote a vibrant, integrated and sustainable marine environment.

The figure-ground theory will be used to investigate the relationships created between merging circulation paths, hard versus soft surfaces, masses against voids within the site and its surroundings. It will then be possible to identify zones of conflict and draw connections between spaces in the urban context.

- ① Reconnect the sea to the city  
Re-establish the ferry terminal
- ② Enhance walkability across the neighbourhood
- ③ Develop main arterial roads

### Land use

-  Wetlands (Permanent wet)
-  Wetlands (Seasonally wet)
-  Conservation area
-  Proposed urban areas
-  Informal settlements re-blocking

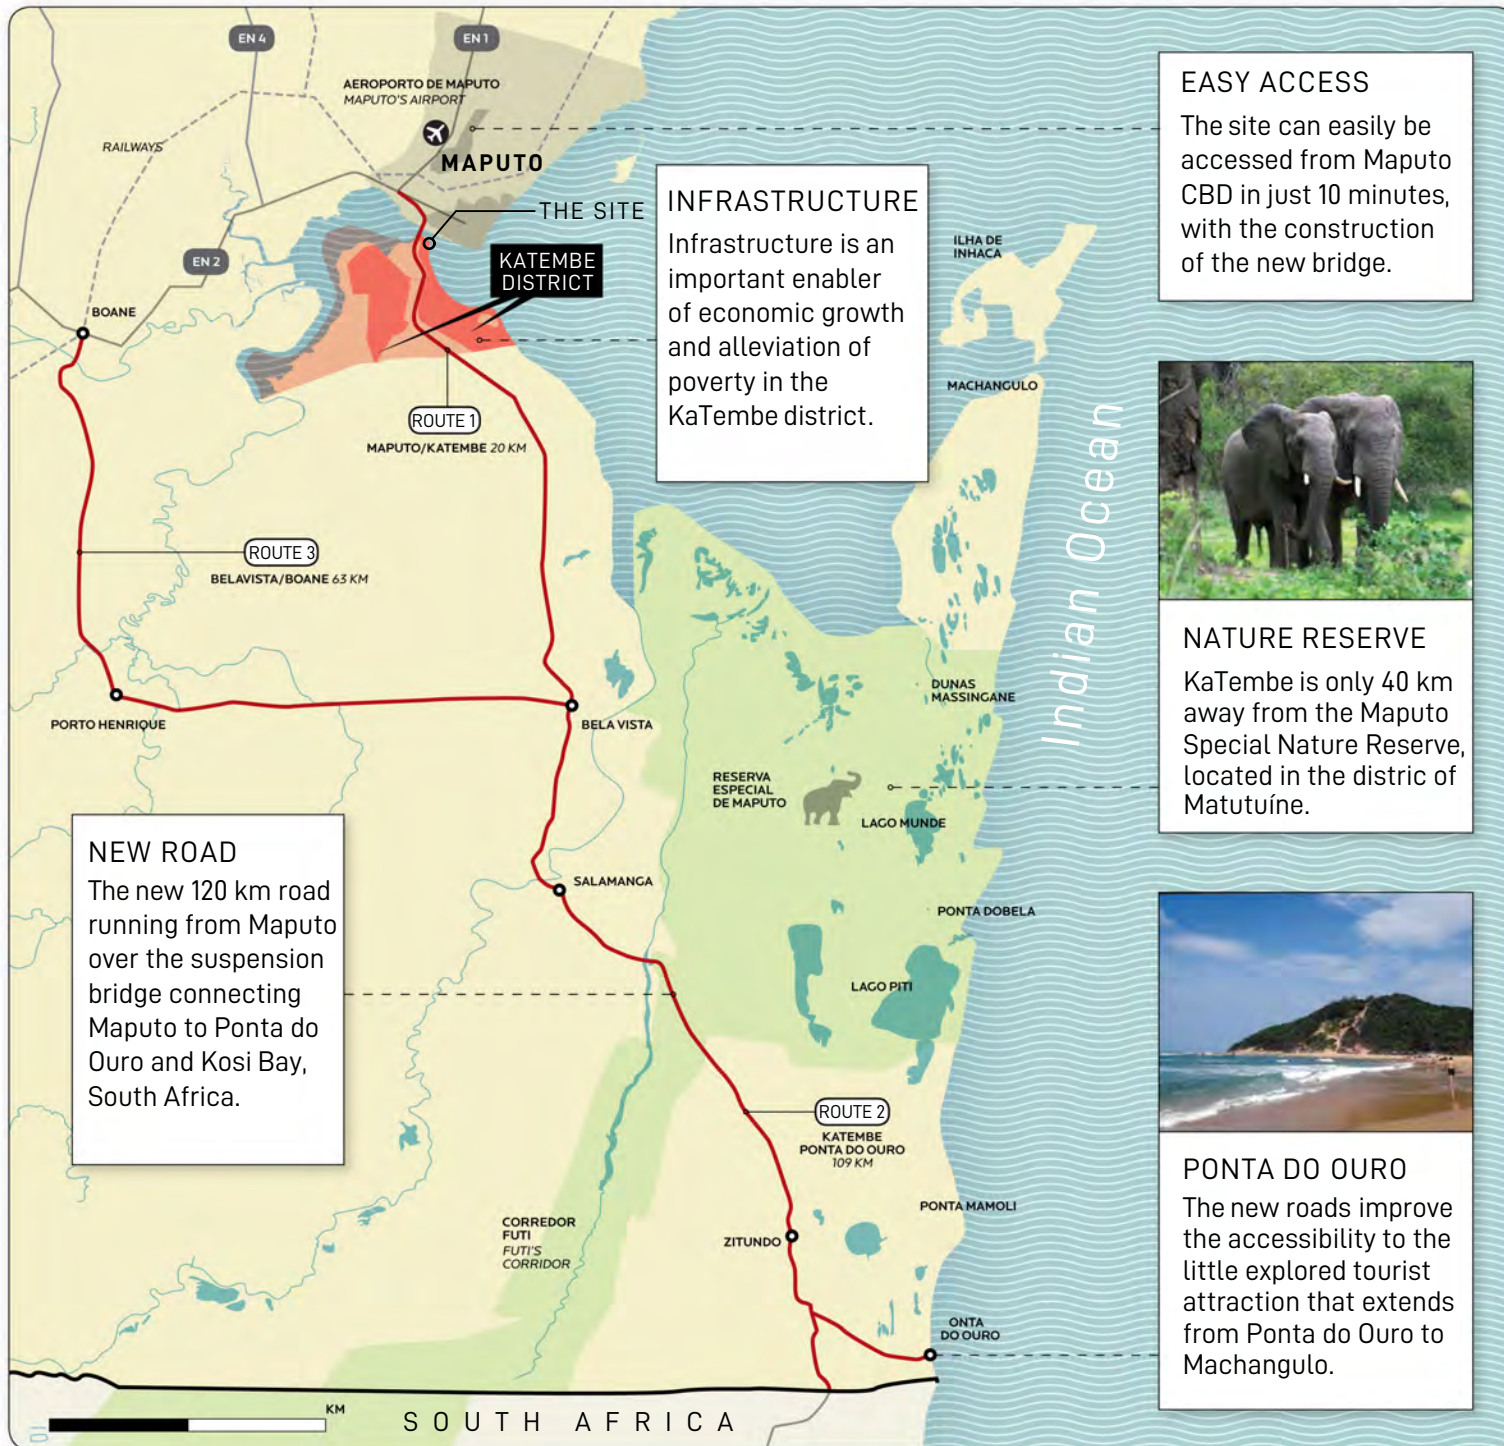

Figure 3.1. Key framework area (Author, 2020)

Figures 3.3 & 3.4. Photos of the new bridge (BETAR, 2016: 3)

### 3.1.1 ACCESSIBILITY

The construction of the Maputo – KaTembe bridge and the road network connecting Maputo to Ponta do Ouro and the road section from Bela Vista to Boane is a crucial starting point for the sustained urbanization of new KaTembe. This makes it possible to quickly access the Maputo Nature Reserve, Ponta do Ouro and South Africa (BETAR, 2016: 03).

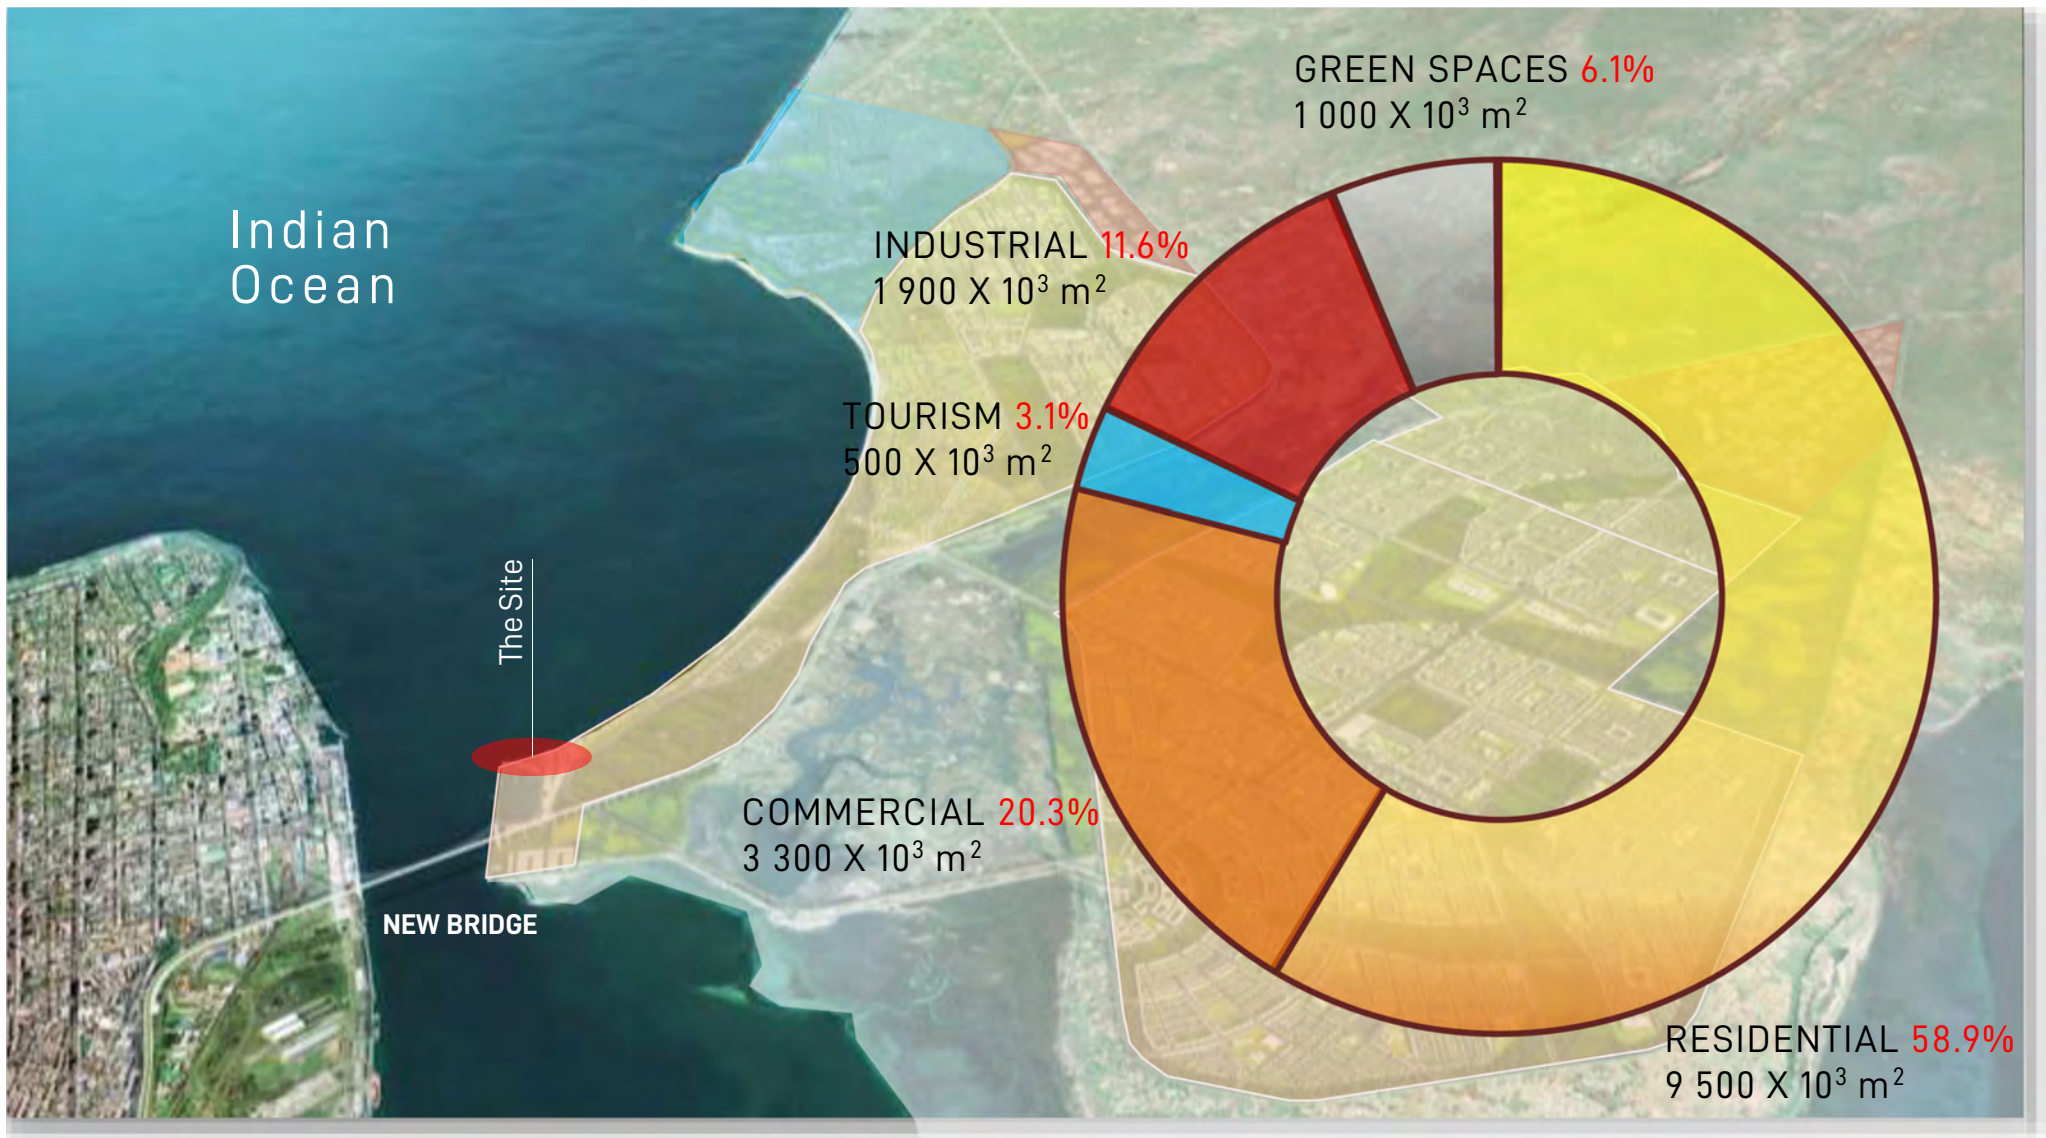

Figure 3.6 Pie chart displaying functional zoning per area (Adapted from BETAR, 2016: 4)

## 3.3 Morphology

### 3.3.1 PRECEDENT STUDY 01:

#### MUSEU DAS PESCAS (FISHERIES MUSEUM )

Architects: José Forjaz Arquitectos

Location: Maputo, Mozambique

Project Year: 2008

Type: Museum

Figure 3.7. Exterior view (José Forjaz Arquitectos, 2008: Online)

The Museu das Pescas (Fisheries Museum) is a competition entry of 2008. Situated on the edge of one of the more important public squares within Maputo, the design investigates questions of maritime themes and phased development (José Forjaz, 2008: Online).

Here, with pursuit for structural economy, the possibility of building transparency is explored in the creation of a large 'nave'-like space, the construction and detailing of which draws on boat-building traditions. In addition to and in synthesis with individual architectural programmes, the site contexts and the manipulation as well as treatment of light, the form of these buildings is also an expression of the structural solution.

Figure 3.8. Interior view (José Forjaz Arquitectos, 2008: Online)

Figure 3.9. Floor plan (José Forjaz Arquitectos, 2008: Online)

In this experimentation with structure and technology, there is always the concern with the 'tension' between the global and the local, as well as the acknowledgement of the developmental context of Mozambique. This is done, not as a refutation of universal technological values but more in recognition of the necessity to 'reconcile technique through culture'.

A central quality of Jose Forjaz Arquitectos' work has been their capacity to interpret the characteristics of the sites/ places for which the projects are conceived. There is always an appreciation and interpretation of the topography of the site which informs the design concepts and the making of micro- urban environments. More than just the understanding of the site, it is evident in this work that design demands of us the ability to interpret the requirements of the architectural brief by connecting it with the fundamental opportunities of the site (Le Grange, 2009: 10).

### Lessons learnt

The sensitivity towards context and place has been applied to the Museu das Pescas within the larger Mozambican context. In this work of José Forjaz Arquitectos there is evident an ongoing critical dialogue with the tradition of modern architecture. However, with such allusions, what remains fundamental is the clear conceptual basis of the project, which in turn gives it its individual unity and formal coherence. And ultimately, what the museum manifests is a reworked and more pertinent version of modernity - a modernity appropriate to the local developmental context and the sub-tropical climate of Mozambique.

Needless to say, these individual design principles are not considered separately in the execution of the work, but are rather synthesised in the act of architectural invention. Together, they have enhanced the human experiential qualities of the building. The remarkable accomplishment of this work is the consistent achievement of all the virtues of 'good building' - of order, of a balance, of coherence and elegance. Here the building form is the result of reason, of honesty and modesty.

### 3.3.2 PRECEDENT STUDY 02: POST INDUSTRIAL APPALACHIA

Instructors: Ed Ford and Luis Pancorbo

Location: Nuttallburg, West Virginia, USA

Project Year: 2017

Type: Public Facility

"The project, located along the former rail spur at the base of the site is a new interpretive and educational facility. Coal, once collected from the top of the mountain was transported to the former rail yard by a conveyer system, terminating at the bottom of the town. Using the architectural detail as the major driver of the building tectonics, the intervention consists of a series of heavy timber trusses cantilevered out over the river from supported by steel support towers" (Shea, 2017: Online).

Figure 3.10.Exterior view (Shea, 2017: Online)

Figure 3.11. Floor plan view (Shea, 2017: Online)

Figure 3.12. Longitudinal section (Shea, 2017: Online)

Figure 3.13. Perspective (Shea, 2017: Online)

### Lessons learnt

Innovative place-making encourages people to explore and participate in their surroundings. The most engaging buildings are those that invite us to take part on many levels, that stimulate all of our senses as well as our intellect. Interaction does not necessarily mean we have to be bombarded by loud music, brilliant colours or video monitors. Rather, the best places invite us to think and propel beyond what we encounter in our day to day routines. At its most basic level, the Post Industrial Appalachia is purely recreational. But what makes this building succeed is the visceral relationship it fosters between people and place. The building is not static structure; interaction is implicit.

At Post Industrial Appalachia, bridges act as sutures; visitors crossing them actively take part in the process of bringing a city and its long-neglected waterfront together. Other gateways, nodes, paths and landmarks in the park welcome an interplay between people and objects, as well as between structure and nature.

Beyond interaction, a sense of history sets this project apart - it has a multilayered origin and unfolding story. The Post Industrial Appalachia, was once industrial waterfront. Through its evolving history, the place gains a new relevance that inspires participation.

## 5.1 Introduction

The aim of this structural report is to critically investigate the structural components of the design with regards to its various constituents used to put the building together, its sustainability and respectable finishes applied. Moreover, the structural philosophy will be explored through a conceptual process of a construction touchstone to further broaden the theoretical platform that the structure embodies.

Through evaluating the site, climate and the typological requirements of the design, a construction approach will be set forth and identified to effectively and contextually address these particular needs of the design. In essence, the technical resolution is strongly rooted in the design concept which was discussed earlier in the document.

## 5.1.1 AN OVERVIEW OF THE PROPOSED PROJECT

This dissertation challenges the largely site-specific and quantitative interpretation of sustainability that persists in the Mozambican design and construction industry, and proposes instead a broader set of parameters that can harness the potential of the built environment to promote and support essential cultural change (CaGBC, 2003: Online; Buchanan, 2011: Online; Vallance, Perkins & Dixon, 2011: 342). After more than two decades in which the quantitative approach has failed to deliver either international consensus or any measurable mitigation of climate change, it is safe to say that sustainable design must now go beyond technological fixes, and embrace a fundamental rethinking of our relationship with the biosphere and with one another. Thus it is advocated that the design of the built environment must engage in more holistic ways of thinking that have emerged in disciplines such as philosophy, psychology, economics and social sciences, among others (Esbjörn-Hargens, 2010: 143; Wilkinson & Pickett, 2010: 347). As a framework it has been taken the philosophy of integral theory proposed by Ken Wilber, which advocates a problem solving methodology that reflects both objective and subjective realities (Esbjörn-Hargens, 2010: 174). In architecture this requires us to go beyond quantitative technical and material solutions and consider social, cultural, psychological and other qualitative implications of design (Buchanan, 2012b: 5). Based on a review of precedent studies from across Mozambique and beyond, the dissertation argues that sustainability must embrace the concept of an interrelated and interdependent 'system of systems' - a civic ecology that includes natural, social, economic and technical synergies, and operates at a variety of scales, beyond the physical boundaries of each project.

Figure 5.1. Photo of structural touchstone (Author, 2020)

## 5.2 Environment and micro climate

### 5.2.1 PROPOSED SITE

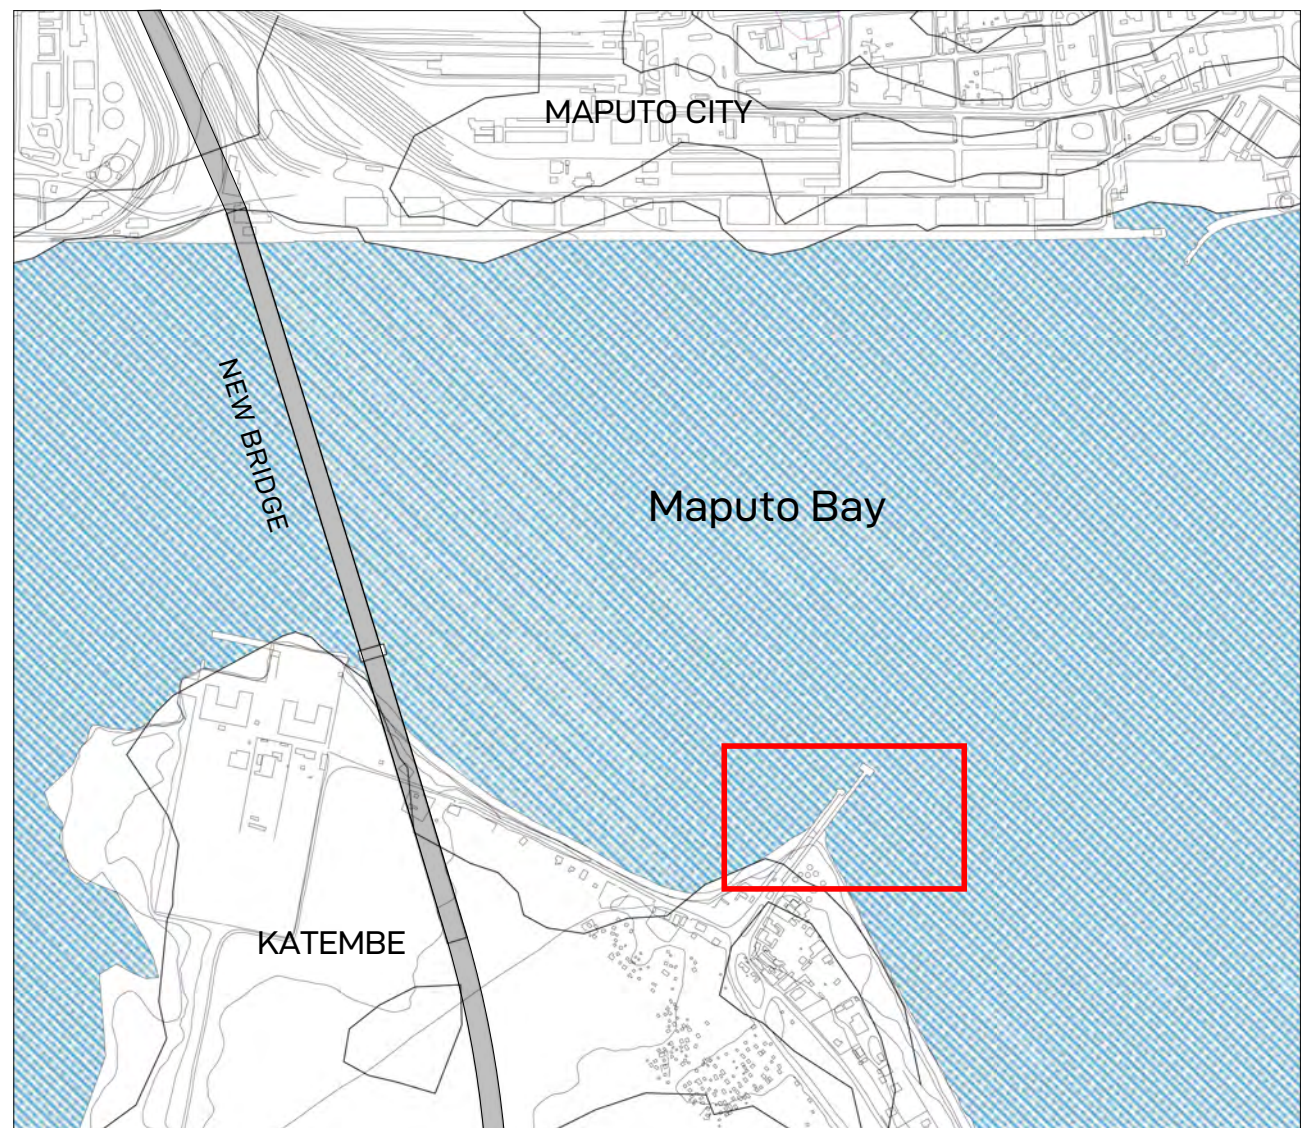

By critically analysing the proposed site's topography, urban fabric, vegetation and climate factors one can better understand the nature of the site and how to respond to it. The proposed site is located on the south bank of the Maputo Bay, in KaTembe district, Mozambique has potential to be transformed into a waterfront for the city. The site used to be a ferry terminal but now is no longer in use due to the construction of a suspension bridge across de Maputo bay. The site has an existing morphology; it has a ferry dock that will be integrated in the new proposal.

### 5.2.2 CLIMATIC CONDITIONS

Maputo has a tropical climate and lies on 48m above sea level. According to Köppen-Geiger system the climate here is classified as Aw. The average annual temperature is 22.7 °C in Maputo (Figure 5.2). The annual rainfall is 781 mm (Climate-Data, 2020: online).

Summer: Hot and humid, but the sea breeze diminishes the heat substantially.

Winter: Cool, dry with less rainfall than in summer.

LOCALITY PLAN

SCALE1: 10 000

Figure 5.2. Maputo's average temperatures in winter and summer (Weather & Climate, 2019: online)

### 5.2.3 TOPOGRAPHY

The site, situated on the water's edge of Maputo Bay is relatively flat. However, the site slopes toward the Indian Ocean (Maputo bay) which runs from South to North. The proposed development thus slopes 2m towards the north.

### 5.2.4 VEGETATION

The site does not have any major trees or existing plants. The design will thus aims to incorporate more green spaces to soften the area to create a likable space that attracts people.

### 5.2.5 SOIL

The soil type of this area is predominantly declared as inner red sand dune. These dunes are composed of reddish, brownish and yellowish wind sands, consolidated by vegetation. The dunes are located inland, generally not far from the present coastline, but they are not part of the current active dune system.

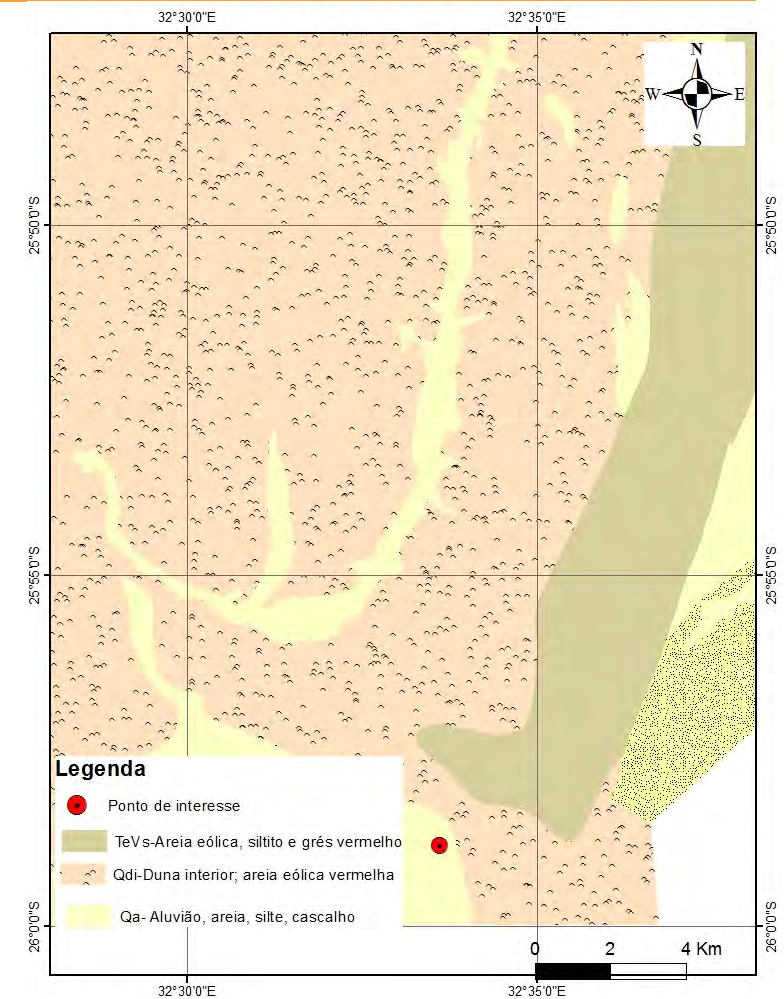

Figure 5.3. Geology of Maputo (Ministry of Mineral Resources and Energy, 2019: online)

## 5.3 Touchstone and structural philosophy

Architecture is a violation of landscape; it cannot simply be integrated, it must create a new equilibrium.

Mario Botta

Figure 5.4. Diagram showing connection of the site with the city (Author, 2020)

With the above in mind, one must work cleverly to navigate the complexities of the coast to design a building that makes the most of, but does not negatively impact, the local environment.

The structural touchstone was derived through a process of abstraction and conceptualization of the initial design process and reaction. As a response, the structural touchstone is another form of expression of the main design objective, a linearity, connectivity and movement thus creating a new connection between humans and marine life of the KaTembe district.

Figure 5.5. Photo of structural touchstone (Author, 2020)

## Timber

- renewable and environmentally responsible
- high strength to weight ratio
- good workability
- natural durability
- high tolerance of short duration loads (Crossman & Simm, 2004: 5)

Figure 5.6. Timber construction (Bayside Group, 2016: Online)

## 5.3.1 MATERIALITY

Materials and construction methods in a coastal environment should be resistant to:

- > flood and wind damage;
- > wind-driven rain;
- > corrosion;
- > moisture and;
- > decay due to sunlight, aging, insects, chemicals, temperature or other factors (FEMA, 2013: Online).

## Steel

- Strongest of all coastal construction material
  - Easily installed
  - High tensile strength
  - No height limitation
- However, it requires a protective coating applied periodically.

Figure 5.7. Steel construction (Indiamart, 2020: Online)

## Concrete

- Extremely strong
- high compressive strength
- must be specifically designed
- natural durability

Figure 5.9. Concrete panel (ArchiExpo, 2020: Online)

## Aluminium

- Aluminium and its alloys have excellent resistance to corrosion.
- However, it's important to choose the right aluminium alloys because they perform differently in saltwater environments.

Figure 5.8. Aluminium construction (STSI Holding, 2018: Online)

## Stone

- Colour and strength;
  - structure of the stone may be stratified (layered) or unstratified;
  - wide diversity of textures;
- Despite its heavy, solid materiality, one can still work with it to achieve diverse forms. (Zilliaccus, 2016: Online)

Figure 5.10. Stone texture (Grossgasteiger, 2020: Online)

## 5.4 Precedent Study

### LA QUINTANA LIBRARY PARK

Architects: Ricardo La Rotta Caballero

Location: Medellín, Antioquia, Colombia

Project Year: 2007

Size: 14,800 square feet

Type: Public Library

#### 5.4.1 INTRODUCTION

The aim of this precedent study is to critically analyse the La Quintana Library in Medellín, Colombia in terms of its design, technical resolution and construction strategies. Through communicative sketches, images and photos the library will examine the site conditions, tectonic and stereotomic structures, sustainability considerations and the building components. This will become a crucial part in developing a technical resolution for the dissertation in design.

The library was designed by Ricardo La Rotta Caballero, is located on the North-western outskirts of Medellín, Colombia. The library is one of five public park libraries that offer various educational facilities and programs to assist the local community. The term "library park" speaks about multifaceted combinations of spaces and architecture that link public and green spaces with a typological library as a platform. The building is 1400m<sup>2</sup> in size and includes facilities such as reading rooms, internet facilities and educational play spaces (ARQA, 2013: Online)

Figure 5.11. Library Exterior View (ARQA, 2013: Online)

The design of the library was fundamentally driven by the existing water channel, thus, in turn the spatial quality of the building is based on a longitudinal plan that creates a linear park through the building. Furthermore, the building, doesn't just act as a park but, rather as a place of transition through making connections with different neighbourhoods in the area through streets that link to the library. The main linear axis that the library forms within the urban fabric receives large amounts of people flowing through it. It is on this axis that the building consists of two big blocks. The lower block, of a passive nature, constitutes the book collection and computer laboratory facilities which exist in a more closed, inclusive area and the upper block, active in nature, is in an open-air public square space for social interactions, and contains a business development centre and a cafeteria (ARQA, 2013: Online).

## 5.4.2 ENVIRONMENT AND MICRO CLIMATE

Figure 5.12. Locality Plan N/Scale (ARQA, 2013: Online)

The site is located in the Aburra Valley on the western side of the Northern Andes Mountains. The city of Medellin sits approximately 1500 meters above sea level and has a cool tropical, wet climate. The city is known as the "City of Eternal Spring" due to its relatively warm temperatures throughout the year (Farjado, 2012: 18). Based on this warm temperature, the original vegetation of the valley consisted of Andean forest, which covered the entire area except the steepest slopes and the marshy areas in the bottom of the valley (Pérez 1993:63).

The La Quintana Library has responded well to the topography in which it is situated. The library's construction and urban landscaping is articulated to fit into rather than being placed on the earth. The building integrates itself into the site and becomes an abstraction of the landscape through its construction methodology.

Figure 5.10

Figure 5.11

Figures 5.13 & 5.14. Illustrations indicating site responsiveness of the scheme (ARQA, 2013: Online)

In addition, the building further narrates with its environment by becoming a form in the place by folding itself and being formed like mountain contours. The design and construction relates back to the folded mountain in its structure and form. The library responds particularly well in the way it defines itself down the slope of the natural mountain scape. This is achieved through stepping the landscape at various intervals forming a progressive walk way through the building and down the site (Curquico, 2013: Online). Through manipulating the earth (cut and fills process) and creating these terraces the environment is enhanced and the library exists in unison with the earth.

### 5.4.3 USER BEHAVIOUR AND REQUIREMENTS

Figure 5.15. Site Plan indicating nodes for social interaction (ARQA, 2013: Online)

The library is critically located in the centre of various neighbourhoods, thus, the library becomes a central beacon between the various neighbourhoods. The general public of the city of Medellin were in drastic need of an educational facility that was accommodated with an improved public social space. As a reaction, La Rotta, the architect successfully identified this need through concentrating on the public spaces which happen around the building through circulation routes which connects various spaces.

The community regards the library as a beacon within the city as it positively addresses the need of the community through providing, computers that are connected to the internet, book collections specializing in different topics, exhibition and recreation rooms, and outdoor greenspace zones where guests can relax and enjoy spontaneous gatherings.

### 5.4.4 FORM AND FUNCTION

The design and structural approach of the library was set out as two independent volumes that materialise through concrete boxes which are located at two different levels due to the contextual topography. The lower block is developed through a series of concrete columns, which extends to the exterior of the building, into an open terrace where a semi-translucent structure covers the entire space (ARQA, 2013: Online).

Figure 5.16. Analytical diagram (Author, 2020)

Figure 5.17. Striking form becoming part of the natural landscape (ARQA, 2013: Online)

This semi-translucent structure is constructed with a primary horizontal element, which functions as a cover, as well as a vertical plane which unfolds from the closed off northern side of the building facing the creek. This structure is formed with a flat steel profile supported by wooden slats, while, when extended a vertical enclosure retains only towards the wooden sections (ARQA, 2013: Online).

The idea behind this structural panel is for the user to perceive this timber pergola as a single entity which assists the user to visually incorporate the green of the creek into the area of the library. Likewise, the screen additionally acts as a bioclimatic function, a sunscreen light filter and the natural circulation of air.

In this sense, a continuous presence of internal and external spaces and the interplay of light is created. The structure and tectonic nature of the library is thus highly driven through the materiality of the building.

The lower block houses the administrative offices, auditoriums and the community care centre. From here, a circular cut in the slab allows one to have a visual connection with the library; which is reached by a sweeping staircase. The library, the primary function of the building, is a large double volume space where various activities occur, such as; computer labs, reading spaces and small class rooms. Along the exterior edge of the concrete walls, that define this space, one can find a ramp leading to a large showroom. The ramp becomes an integral part of the design by making the movement through the building an experience, rather than a space of transition only.

Figure 5.18. Pergola (ARQA, 2013: Online)

Ultimately, the form and function of the library aims to create a constant relationship between the city, the creek and the natural landscape in which it sits through fragmenting the internal, external and transition routes. This is achieved through the composition of various materials (timber, concrete thus interplay of stereotomic and tectonic), structures (grid of concrete and steel columns) and soft spaces [grass and water] (Curquico, 2013: Online).

#### 5.4.5 HORIZONTAL AND VERTICAL CIRCULATIONS

The library makes use of two types of circulation, namely: staircases and ramps.

##### 5.4.5. a) RAMPS

The ramp occurs between the lower and upper level of the site. Thus, the design suggests sensitivity toward handicapped users. The library part of the design is accessed by the ramp from the lower level; therefore everyone has access to the most important part of the complex. The ramp adds a particular fluidity and flexibility to the circulation that makes it easy for all users. The ramp thus becomes a transition space of interaction.

##### 5.4.5. b) STAIRCASES

The use of a continuous staircase is applied throughout the building to create a relationship between the levels on site. This continuous staircase (figure 5.20) is designed and constructed to allow for a smooth transition between the levels through making use of small risers and larger treads.

Figure 5.19. Exterior view from the ramp (ARQA, 2013: Online)

Figure 5.20. Exterior view (ARQA, 2013: Online)

## 5.4.6 STRUCTURAL DETAILING

### 5.4.6 a) STEEL FRAME

Together, with the concrete columns, a steel frame is introduced which allows the library to have internal free spaces and curtain walls. The use of steel was chosen due to its great strength and flexibility. Steel has the ability to bend and flex without cracking when the structure is pushed to one side by wind or earth movement.

### 5.4.6 b) IN-SITU CAST CONCRETE WALLS

Due to the large slope or fall on site the construction called for large in situ cast concrete walls to carry the load of the earth pushing down onto the bottom of the earth.

### 5.4.6 c) PARKING DETAILS AND STANDARDS

The building is situated in the centre of various neighbourhoods. Thus, the design and the lifestyle of the city allow the users to access the building through public transport and by foot. The only parking that was provided is for the permanent staff. Hence, 15 parking bays were provided and about 10 motor-bikes parking's.

### 5.4.7 CONCLUSION

The library has proven to be a public building which redefines and re-establishes a public realm in the city of Medellin through its simple form and spaces between the buildings.

Through making use of simple material and construction methods the spaces of the building have proven to be one which is equally important internally and externally. The architect cleverly manipulated the slope of site to create spaces for sitting and circulation at the same time.

Figure 5.21 Typical steel decking concrete floor detail (Author, 2020)

## 5.5 Sustainability report

### 5.5.1 OPEN SPACE AND SUSTAINABLE IDENTITIES

#### INTERPRETIVE CORRIDORS

STREETS BECOME EDUCATIONAL AND INTERPRETIVE CONNECTORS THAT FEATURE HISTORICAL, ENVIRONMENTAL AND COMMUNITY INITIATIVES

Figure 5.22. Photo collage (Adapted from Evely, 2013: Online)

#### STORMWATER INFRASTRUCTURE

INTEGRATED STORMWATER MANAGEMENT INCLUDES POSSIBLE STREESCAPE REMEDIATION, STORMWATER CATCHMENT AND REUSE

Figure 5.23. Photo collage (Adapted from Evely, 2013: Online)

## ROUTES, PATHS, CIRCUITS AND OVERLOOKS

A LAYERED PATH SYSTEM PROVIDES A WATERFRONT ESPLANADE, LOOPING ACTIVITY CIRCUITS AND PANORAMIC OVERLOOKS, PARK FOYERS FRAME ENTRANCES AT THE URBAN EDGE WHILE PATH ARMATURES PROVIDE ACCESS TO THE TIDAL ECOSYSTEM.

Figure 5.24. Photo collage (Adapted from Evelly, 2013: Online)

## PROGRAMME OPPOTUNITIES

ACTIVE AND RECREATIONAL PROGRAMME ARE ARRAYED IN THE NORTHWEST SECTION OF THE PARK WHILE A PASSIVE AND LEISURE PROGRAMME ARE INTERWEAVED WITH NATIVE ECOLOGICAL COMMUNITIES IN THE SOUTH

Figure 5.25. Photo collage (Adapted from Evelly, 2013: Online)

## ECOLOGICAL OPPOTUNITIES

A SEQUENCE OF ECOLOGICAL COMMUNITIES STRANDS THROUGH THE PARK WITH TIDAL SYSTEMS AT THE WATER'S EDGE AND UPLAND PLANTINGS INHABITING HIGHER GROUND.

Figure 5.26. Photo collage (Adapted from Evelly, 2013: Online)

## 5.5.2 FAÇADE DESIGN

A key innovation of the building is the double-skin façade that has a system of automatically controlled blinds between the internal double-glazed system and the external single-glazed skin which will track the sun as it moves across the building.

The inside skin forms the building envelope. Heat captured between the inner and outer skin during the summer is ventilated outside through natural convection. In the winter, this hot air is captured between the two skins, forming a warm blanket, protecting the building from the elements. The high-performance façade reduces solar heat gain while maximising the natural light penetration into the building.

The architectural concept called for large areas of glass and for this to be as transparent as possible. Normally this would result in energy wastage through solar gains in summer and heat loss in winter. There would also be problems with glare in all seasons, resulting in discomfort for the occupants. These issues are exacerbated by the siting of the building at the water's edge and subject to glare from the sea as well as the sky.

Figure 5.27. Edge detail (Author, 2020)

### 5.5.3 BREEZE BLOCKS

The period of Mozambican architecture between the 1930s and 1960s has always been internationally recognized as one of the most important in the architectural history of the country by the Mozambican Academy. This period, known as modern architecture, has been evaluated in relation to the treatment of environmental issues and solutions for passive conditioning developed by Mozambican architects of the time, such as Pancho Guedes, Joao Tinoco and Jose Forjaz. The influence of colonial architecture, which has been studied in the treatment of the envelope of buildings, is presented as the greatest contribution from that historical period for the development of modern architecture at a national and international level.

Figure 5.28. Typical breeze blocks used in Mozambique  
(Adapted from Design Indaba, 2014: Online)

Figure 5.29. Entrance of Instituto Missionario das Irmãs do Precioso Sangue (1997) (José Forjaz Arquitectos, 2020: Online)

Figure 5.30. Passage of Instituto Missionario das Irmãs do Precioso Sangue (1997) (José Forjaz Arquitectos, 2020: Online)

Within the range of work the response to context is not limited to an interpretation of the physical site only, but also to the local climate- in each of the buildings investigated, simple environmental concerns have been considered - long before 'green' architecture had assumed its current fashionable status. With such responses have come formal design decisions, such as the insistence on cross-ventilation and the careful control of sunlight - responses that have affected the plan and sections of buildings as well as their formal composition. More recently, and more comprehensively, the large-scaled Instituto Missionario das Irmãs do Preciosos Sangue project (Figures 5.29 and 5.30) incorporates the collection of rainwater, the recycling of grey water and the harnessing of solar energy.

Figure 5.31. Hallway of Instituto Missionario das Irmãs do Precioso Sangue (1997)  
(José Forjaz Arquitectos, 2020: Online)

Figure 5.32. Detail of breeze block at Caracol condominium (2004)  
(José Forjaz Arquitectos, 2020: Online)

Figure 5.33. Entrance of Caracol condominium (2004)  
(José Forjaz Arquitectos, 2020: Online)

This attention to climate has also obviously informed decisions about the use of appropriate materials. In an economy of scarcity where high transport costs prevail, the use of local materials obviously makes sense. Typically brick (or concrete block) walls, concrete floor and roof slabs, and marble or clay tile floors allow for a high thermal inertia. Breeze-block screens, which have become a 'trademark' of their work, are often employed to control the sub-tropical sun and also to deal with issues of security. Where budgets allow, timber screens/shutters, of the wonderful local hardwood Chanfuta (*Afzelia quanzensis*) are used sparingly.

Related to the issue of context is the purposeful engagement with technology and construction that is inherent in all the work. There is within this body of work a relentless quest for an economy of structure and for a structural integrity from which an honest formal architectural expression is derived. With this exploration different themes of construction have over the years been investigated.

## 5.6 Conclusion

As a community in Mozambique a space should be identified, claimed to serve as a platform where communities can access their past and furthermore tie a direct link to their relevance in a larger world, where their origin is rooted. A new spatial intervention in areas stretches out to communities to initiate a process whereby they can also play a pivotal part to the functioning and narrative of the city.

This new 'public realm' should exist as a container which connects and brings urbanism, modernity, history and culture into context with another. It should have the ability to transform the individual within the space to look back into the past with a specific nostalgia, but more importantly have the ability to excite them for the future - a reconceptualised framework. The purpose of this is to achieve levels of tolerance, trust and understanding necessary to support a truly democratic city. The role of designers is to inflate the built environment with memory as key in spatial planning and design (Mammon & Patterson, 2005: 2).

As architects and designers are seeking more meaningful and creative outlets through which they can utilise their skills to create a more just and sustainable world. New standards of education and practice are emerging and a shift in priorities is beginning to reveal itself in an attempt to address the world's most pressing problems.

With urbanisation taking place at a faster rate than expected, it is important to address the needs of entire communities as well as break away from the traditional practice of architecture which can under-emphasise the social component of design. Embedded within this is a call for inclusive design - design that is reflective of the unique qualities of individual communities but also meets the needs of multi-dimensional populations. Although there is an increase in social impact programmes geared toward architects and designers, there is still a shortage of options available in universities for individuals to get involved in projects that make a difference.

CONFUCIUS, *ANALECTS*

## i. Reflection

Resources for designing an aquatic science park were somewhat limited. After assembling what I could from libraries, I found that I only had a few of the pieces of the puzzle with little sense of how they would need to fit together. In order to compensate for this deficiency of information, I conducted a series of precedent studies of similar typology and/or theme of enquiry which would enable me to fill in the gaps. The pieces and possibilities of what such a facility could offer started to reveal themselves to me.

The issues of siting a research facility at the Katembe ferry dock were my first major hurdle. The impact on the city beach did not favorably impress the people in the surrounding neighbourhoods. The community feared that the construction of the facility would result in restricted access to the beach, as well as impinging on the serenity of their own properties. Considering the impact of aquariums in other cities, this concern was not without reason.

The next problem was the need for the aquatic science park to reflect and express the place where it is sited, thus drawing for inspiration on local culture. Associated with this position there is a profound regard for history and a dialectical materialist understanding of it, which in turn has informed my appreciation of architectural history.

Through a commitment towards upholding the abovementioned values and design principles I resisted an engagement with the unsustainable practice of suburban development, and with the destructive threat of an emerging mass tourism that is being wrought on Mozambique. With such beliefs I have opposed the growing perception that architecture is only about 'form' and I have opposed the false veneration of the architectural object. And by doing so, the work demonstrated that good architecture, well-considered urban design and responsible planning decisions, in this time of political and economic uncertainty, can contribute towards improving the built environments of our post-colonial and post-modern condition.

In conclusion, the overall scheme of the aquatic science park met the ideas set forth in my thesis statement. The design challenges were solved by referring back to that statement and setting up a dialogue from which I could draw ideas for possible solutions. I embraced the technology in the design and I believe the work has made an indelible impression on the reconstruction of an architectural culture in Mozambique.
